Optical Graphic Extension Module

- Fibres Detachable -

Description

The Digital Visual Interface is a high-quality, uncompressed data link protocol between a host processor video card and a display peripheral. Glass optical fiber (GOF) technology for this transmission stretches the performance beyond the limitations of copper wire with longer length, data security, negligible RFI/EMI and the elimination of costly analog distribution systems.

The EDID parameters in a display can be read and restored by plugging the Transmitter module into the display. This self-EDID programming feature virtual DDC (vDDC) feature makes the field installation of M1-201DA-TR easy and flexible for nearly all contemporary display systems.

The four DVI optical signals - Red, Green, Blue and Clock are multiplexed and de-multiplexed through Course Wave Division Multiplexing (CWDM) optical modules. The graphics data can be extended up to 1,500 meters (4,920ft) at WUXGA resolution (1900x1200), 60Hz vertical refresh rate over two (2) LC fibers.

An external +5VDC power adapter is likely required for the receiver module. Most video cards can provide +5V DC power to the transmitter module but it likewise has provision for external power. The transmitter and receiver modules are clearly labeled to prevent reverse installation of the modules.

The modules are constituted of three parts as follows;

- One transmitter converting electrical to optical signals, model name: M1-201DA-T
- One receiver converting optical to electrical signals, model name: M1-201DA-R
- Two AC Adaptors to 110V-240V with DC 5V 1A outlet

Functions

- Self-EDID Function

The EDID in a display can be read and restored by just plugging it to the display. This self-EDID programming feature makes the installation of M1-201DA more easy and flexible at any variable resolution display systems.

- Auto Power Selection and Power Protection in Transmitter Module

The laser diodes are lit only when +5V voltage should be supplied into the 14-pin in DVI connectors.

The transmitter (Tx) module of M1-201DA-TR is designed a power protection circuit from conflict of power supply between the external DC power adapter and your graphic card through the DVI pin. It offers an option of whether to use an AC/DC power adapter depending on power supply capability of the graphic card through the +5V pin, you are using.

- **Signal Detect Mode in Receiver Module**

It offers squelch function blocking output signals when optical input power is lower than as specified in a certain case, for instance, loosing optical connectors.

Drawing

Dimension [mm]

Note: The transmitter, M1-201DA-T and the receiver, M1-201DA-R have the same mechanical dimensions.

Fiber Connection

The diagram shows the connection of transmitter (Tx; plug in PCs) and receiver (Rx; plug in displays) modules by using one dual LC patch cords fibers or 2 separate LC patch cord fibers.

Warning; Dual LC patch cords made by some manufacturers could not fit in together since width of their plastic couplers are too wide to plug in M1-201DA-TR's LC receptacles. We recommend it to be 12.40 mm (not over 13.0mm).
