TITAN HD EXTRACT

Titan HD Extract uses one 4K camera to create three HD video signals. One signal is a SuperSample of the full image area and two are windows selected from within the original input. These windows can be panned smoothly through the 4K field. A fourth HD signal is recorded from the live-switch. All four HD signals can be recorded simultaneously as Apple ProRes with matching timecode and filenames. The Titan HD Extract upgrade is available October 2016 for Convergent Design Apollo and Odyssey Monitor/Recorders.
